Project Proj	Int revision by Umbrello et al. 2023 - A new species described after analysing evidence of genetic divergence, objourned and descriptions, differences in habitat and geography. REFERENCE: apress.com/zt/article/view/zootaxa.5330.1.1 Inged from Sminthopsis longicaudata to Antechinomys longicaudatus by precedence - based on new DNA to and 6 nDNA loci) and existing morphological analyses, which allied S. longicaudata as sister to surfager. This clade was in turn postioned to the exclusion of all other Sminthopsis. The species epithet is seeded the -us suffix to match the (masculine) gender of genus Antechinomys. Please Note. The AMTC Australian Mammal Species List contains two sheets: a main species/subspecies list, followed by an auxiliary list of unnamed taxa († Extinct). The contents of the 'Other Common Names' column were originally sourced from mammal species accounts compiled by experts for the forthcoming publication: Strahan's Mammals of Australia (4 the Edition). The AMTC acknowledges that the listed mammal mmon names are not complete because they will differ depending on the cultural heritage, language and knowledge practices of First Nations Peoples across Australia. The Australian Mammal Species List is updated annually, and we welcome suggested changes and diversity of traditional knowledge ustoms and practices. 	Canic	familiaris					
	Canis	jamiliaris		Linnaeus, 1758	Dingo	Wild Dog, Warrigal	When taken in the context of the entire canid phylogeny, the Dingo is not a divergent monophyletic lineage separate from
							other canid species (e.g., Zhang et al. 2020). The global canid phylogeny continues to be improved with more comprehensive
							data (e.g., Bergstrom et al. 2020), supporting the phylogenetic position of the Dingo as part of an Asian lineage of domestic
							dogs. The IUCN Canid Specialist Group (Alvarez et al. 2019) placed the dingo under the binomial Canis familiaris. The Dingo
							as genetically divergent from other domestic dogs as they are to each other, and mtDNA reveals shared haplotypes with
							domestic dogs and New Guinean singing dogs (e.g., Oskarsson et al. 2012). The evidence does not suggest the Dingo is a
							unique divergent lineage from the New Guinea singing dog or southeast Asian dogs. The evolutionary history of the Dingo
							needs to reflect its position in the entire lineage of Asian and Melanesian dogs, including the lineage distribution outside
							Australia. Species typically need hundreds of thousands to millions of years to diverge. The recent arrival and isolation of the
							Dingo in Australia (probably within the last 4,000 years) has resulted in some distinct features, likely due to founder effects,
							selection and genetic drift. Although the Dingo appears to show some functional differences (e.g., Field et al. 2022), and
							population genetic structure (Cairns et al. 2023), such differences are at a population level and do not translate to
							reproductive isolation. The Dingo's distinct ecological and behavioural features are not diagnostic of species status. Therefor
							the weight of evidence strongly suggests that Dingoes should not be considered as a different species from domestic dogs, a
							thus, they are placed here under Canis familiaris as a distinct population of wild canid. Future research will of course continu
							to inform the taxonomic status of dingoes, other dogs and wolves. The Dingo has important cultural, ecological and
							management value. The taxonomic placement of the Dingo in no way diminishes the importance of conserving them as an
							ecologically important animal in Australian ecosystems. REFERENCES: Alvares et al. 2019 (Canid Specialist Group Meeting);

	Mesoplodon	layardii		(J.E. Gray, 1865)	Strap-toothed Beaked Whale	Layard's Beaked Whale, Strap-toothed Whale	
	Mesoplodon	eueu		Carroll, McGowen, McCarthy, Marx, Aguilar, Dalebout, Dreyer, Gaggiotti, Hansen, van Helden, Onoufriou, Baird, Baker, Berrow, Cholewiak, Claridge,	Ramari's Beaked Whale		Based on a recent revision by Carroll et al. 2021 - Mitogenome and ddRAD-derived phylogenies demonstrated reciprocally monophyletic divergence between <i>M. eueu</i> and True's beaked whale (<i>M. mirus</i>) from the North Atlantic, under which it was previously subsumed. Morphometric analyses of skulls also distinguished the two species. Thus, the species that occurs in Australian waters should be referred to as <i>Mesoplodon eueu</i> . Note: this species has been listed by the Marine Mammal Taxonomy Group in 2022. REFERENCES: https://royalsocietypublishing.org/doi/epdf/10.1098/rspb.2021.1213

Higher taxonomic rank summary	Genus	species	subspecies	Author	Common Name	Other Common Names	COMMENTS
	Tursiops	truncatus	truncatus	(Montagu, 1821)	Common Bottlenose Dolphin		
Family Phocoenidae							
	Phocoena	dioptrica		Lahille, 1912	Spectacled Porpoise		

AUXILIARY LIST: UNNAMED TAXA						
Family	Genus	species	subspecies	Common Name	Other Common Names	COMMENTS
Muridae	Notomys	sp. 1 [†]				Start et al. 2011
Muridae	Notomys	sp. 2 †				Start et al. 2011
Muridae	Pogonomys	sp.		Tree Mouse	Prehensile-tailed Rat, Soft-haired Tree-mouse	
Muridae	Pseudomys	sp. †				Start et al. 2011
Rhinonycteridae	Rhinonicteris	aurantia	unnamed subsp.	Pilbara Diamond-faced Bat	Pilbara Leaf-nosed Bat, Orange Leaf-nosed Bat (Pilbara form), Golden Horseshoe Bat	Armstrong, 2006
Vespertilionidae	Scotorepens	sp.		Central-eastern Broad-nosed Bat		
Balaenopteridae	Balaenoptera	acutorostrata	unnamed subsp.	Dwarf Minke Whale	Common Minke Whale (diminutive form)	Rice, 1998

Version History						
Date Issued / Revised (DD/MM/YYYY)	Summary of Changes to new version	Approved by				
11/11/2024	Created Version 4.2	AMTCSC 2020-2024				
	Sminthopsis nitela - elevation from subspecies (see Comments column for details)					
	Amended Other Common Names list for Dasyurus geoffroii and Bettongia penicillata					
	Amended extinct status of three species on the Auxiliary List
